What changed in the browser assessment

Reduce duplicate work, bound CPU parallelism, lower live sensor cadence, and preserve explicit failures.

1 Remove the duplicate display

RViz disabled for the browser assessment.

Gazebo minimized after launch inspection.

Qualified Ogre sensor rendering retained.

2 Bound CPU and thread use

Container restricted to 8 physical cores.

OpenMP: 2 workers, thread limit 4.

BLAS: 2 workers; passive OpenMP waiting.

3 Reduce live RGB-D to 15 Hz

Live cadence reduced from 30 to 15 Hz.

960 × 540 geometry and clipping retained.

Capture and legacy defaults remain 30 Hz.

4 Report the real stop cause

Read terrain stop evidence before PID lookup.

Retry only a vanished login-session race.

Do not retry completed terrain attempts.

Retained: 90°C stop · sensor freshness · motion guards · float64 terrain · HIP flags 4

Verified: 16 Linux regression tests, five minutes of stationary mapping, and a brief 0.05 m/s drive.

The new model and accepted launchers were preserved. The successful checks cover this browser profile; longer endurance remains unqualified.
